Adding Dense Layers

- A dense layer is a deeply connected neural network layer. It is the most common and frequently used layer.

```
# Adding a fully connected layer
classifier.add(Dense(units=128, activation='relu'))
classifier.add(Dense(units=5, activation='softmax')) # softmax for more than 2
```

- The number of neurons in the Dense layer is the same as the number of classes in the training set.
- The neurons in the last Dense layer, use softmax activation to convert their outputs into respective probabilities.

- Understanding the model is a very important phase to properly using it for training and prediction purposes.
- Keras provides a simple method of a summary to get the full information about the model and its layers.

```
classifier.summary()#summary of our model
```

```
Model: "sequential"
